

## **Tune-Up Procedure and Power Tune-Up – Power Limiting**

1. It must provide an operational voltage (3.5~4.2V DC) to turn on the phone and on one certain channel in service mode by means of company proprietary software.
2. Base station simulator (Rohde& Schwarz CMU200 or Agilent 8960) measures the WCDMA phone specific RF characteristics.
3. The maximum gain of each individual phone is adjusted until the target value met.

For GSM Ber < 2% at static condition

GSM 850 RX sensitivity < -106dBm

PCS1900 RX sensitivity < -105dBm

For GPRS Bler <10% at static condition

| Type of channel | GSM850 GPRS | PCS1900 GPRS |
|-----------------|-------------|--------------|
| CS1             | -107        | -106         |
| CS2             | -107        | -106         |
| CS3             | -107        | -106         |
| CS4             | -104        | -103         |

For WCDMA Ber < 0.001% at static condition

WCDMA RX sensitivity < -106dBm

Then these appropriate gain settings are stored in each phone individually. The user has no possibility to change these settings later on, and during manufacturing each phone will be individual calibrated. The measurement is done in fully calibrated setup, which is based on a Agilent 8960 base station simulator. Furthermore, the highest power level is verified afterwards in a call measurement on three channels (low, middle and high).
